Materials Selection and Applications in Mechanical Engineering Aravamudhan Raman.2007 Unlike any other text of its kind, *Materials Selection and Applications in Mechanical Engineering* contains complete and in-depth coverage on materials of use, their principles, processing and handling details; along with illustrative examples and sample projects. It clearly depicts the needed topics and gives adequate coverage with ample examples so that ME students can appreciate the relevance of materials to their discipline. Featuring the basic principles of materials selection for application in various engineering outcomes, the contents of this text follow those of the common first-level introductory course in materials science and engineering. Directed toward mechanical engineering, it introduces the materials commonly used in this branch, along with an exhaustive description of their properties that decide their functional characteristics and selection for use, typical problems encountered during application due to improper processing or handling of materials, non-destructive test procedures used in maintenance to detect and correct problems, and much more. What's more, numerous examples and project-type analyses to select proper materials for application are provided. With the use of this unique text, teaching a relevant second-level course in materials to ME majors has never been easier. Covers all aspects of engineering materials necessary for their successful utilization in mechanical components and systems. Defines a procedure to evaluate the materials' performance efficiency in engineering applications and illustrates it with a number of examples. Includes sample project activities, along with a number of assignments for self exercise. Keeps chapters short and targeted toward specific topics for easy assimilation. Contains several unique chapters, including microprocessing, MEMS, problems encountered during use of materials in mechanical components, and NDT procedures used to detect common defects such as cracks,

porosity and gas pockets, internal residual stresses, etc. Features commonly used formulae in mechanical system components in an appendix. Several tables containing material properties are included throughout the book.

Corrosion Problems and Solutions in Oil Refining and Petrochemical Industry Alec Groysman.2016-10-24 This book addresses corrosion problems and their solutions at facilities in the oil refining and petrochemical industry, including cooling water and boiler feed water units. Further, it describes and analyzes corrosion control actions, corrosion monitoring, and corrosion management. Corrosion problems are a perennial issue in the oil refining and petrochemical industry, as they lead to a deterioration of the functional properties of metallic equipment and harm the environment - both of which need to be protected for the sake of current and future generations. Accordingly, this book examines and analyzes typical and atypical corrosion failure cases and their prevention at refineries and petrochemical facilities, including problems with: pipelines, tanks, furnaces, distillation columns, absorbers, heat exchangers, and pumps. In addition, it describes naphthenic acid corrosion, stress corrosion cracking, hydrogen damages, sulfidic corrosion, microbiologically induced corrosion, erosion-corrosion, and corrosion fatigue occurring at refinery units. At last, fouling, corrosion and cleaning are discussed in this book.

Laser Cladding of Metals Pasquale Cavaliere.2020-11-05 Laser cladding is an additive manufacturing technology capable of producing coatings due to the surface fusion of metals. The selected powder is fed into a focused laser beam to be melted and deposited as coating. This allows to apply material in a selected way onto those required sections of complex components. The process main properties are the production of a perfect metallurgically bonded and fully dense coatings; the minimal heat affected zone and low dilution between the substrate and filler material resulting in functional coatings that perform at reduced thickness, so fewer layers are applied; fine, homogeneous microstructure resulting from the rapid solidification rate that promotes wear resistance of carbide coatings; near net-shape weld build-up requires little finishing effort; extended weldability of sensitive materials like carbon-rich steels or nickel-based superalloys that are difficult or even impossible to weld using conventional welding processes; post-weld heat treatment is often eliminated as the small heat affected zone minimizes component stress; excellent process stability and reproducibility because it is numerical controlled welding process. The typical applications are the dimensional restoration; the wear and corrosion protection; additive manufacturing. The wide range of materials that can be deposited and its suitability for treating small areas make laser cladding particularly appropriate to tailor surface properties to local service requirements and it opens up a new perspective

for surface engineered materials. The main key aspect to be scientifically and technologically explored are the type of laser; the powders properties; the processing parameters; the consequent microstructural and mechanical properties of the processed material; the capability of fabrication of prototypes to rapid tooling and rapid manufacturing. Distills critical concepts, methods, and applications from leading full-length chapters, along with the authors's own deep understanding of the material taught, into a concise yet rigorous graduate and advanced undergraduate text; Reinforces concepts covered with detailed solutions to illuminating and challenging industrial applications; Discusses current and future applications of laser cladding in additive manufacturing.
