Radio Network Planning Guidelines for 4G Technologies Nafiz Imtiaz Bin Hamid.2013 Radio Network Planning is the process of assigning frequencies, transmitter locations and parameters of a wireless communications system to provide sufficient coverage and capacity.It remains an essential process for network operators. 4G also known as Beyond 3G- refers to the fourth generation of wireless communications. Network operators are deploying 4G wireless networks to effectively deliver next-generation broadband services to an expanding base of consumers eager to experience media-rich applications. Still operators are quite aware of the fact that effective 4G radio planning indeed is a challenging issue. Again, from academic perspective, the detail of this radio planning process isn't easily available for a thorough understanding. As a result, it almost has become a common view to leave this domain to industry alone. While 4G LTE promises to increase network capacity, improve QoS and significantly enhance data rates; brings new design challenges. This book aims to cover the 4G radio network planning process through LTE. A blended approach- combining background theory and practical through Dhaka city LTE radio planning using necessary simulators has been followed here.

LTE-Advanced and Next Generation Wireless Networks Guillaume de la Roche,Andrés Alayón-Glazunov,Ben Allen.2012-11-05 LTE- A and Next Generation Wireless Networks: ChannelModeling and Performance describes recent advances inpropagation and channel modeling necessary for simulating nextgeneration wireless systems. Due to the radio spectrum scarcity,two fundamental changes are anticipated compared to the currentstatus. Firstly, the strict reservation of a specific band for aunique standard could evolve toward a priority policy allowing theco-existence of secondary users in a band allocated to a primarysystem. Secondly, a huge increase of the number of cells isexpected by combining outdoor base stations with smaller cells suchas pico/femto cells and relays. This evolution is accompanied withthe emergence of cognitive radio that becomes a reality interminals together with the development of self-organizationcapabilities and distributed cooperative behaviors. The book is divided into three parts: Part I addresses the fundamentals (e.g. technologies, channelmodeling principles etc.) Part II addresses propagation and modeling discussing topicsuch as indoor propagation, outdoor propagation, etc. Part III explores system performance and applications (e.g.MIMO Over-the-air testing, electromagnetic safety, etc).
