Project Planning, Scheduling, and Control in Construction Calin M. Popescu,Chotchai Charoenngam,1995-03-20 Critical Path Method (CPM) and Performance Evaluation and Review Technique (PERT) are widely recognized as the most effective methods of keeping large, complex construction projects on schedule, under budget, and up to professional

standards. But these methods remain underused because they are poorly understood and, due to a host of unfamiliar terms and applications, may seem more complicated than they really are. This encyclopedia brings together, in one comprehensive volume, all terms, definitions, and applications related to the time and cost management of construction projects. While many of these terms refer to ancient and venerable building practices, others have evolved quite recently and refer specifically to modern construction and management techniques. Sources include hundreds of professional books, trade journals, and research publications, as well as planning and scheduling software vendor literature. The detailed glossary of all applicable terms includes a cross-referenced listing of examples that describe real-world applications for each term supplied. An extensive bibliography covers all applicable books, articles, and periodicals available on project planning, scheduling, and control using CPM and related subjects. This book is an important quick reference and desktop information resource for construction planners, schedulers, and controllers, as well as civil engineers and project managers. It is also the ultimate research tool for educators, students, or anyone who seeks to improve their understanding of the management of modern construction projects.

Construction Methods and Planning J.R. Illingworth, 2002-09-26 This new edition of John Illingworth's popular book provides a thorough introduction to the selection of construction methods, their planning and organization on site. Thoroughly revised and updated, Construction Methods and Planning takes a practical, down-to-earth approach and features numerous examples and illustrations taken from real situations and sites. In Part One, the main factors which determine the planning of construction methods - site inspections, the site itself, temporary works, design, cost concepts and selection of plant and methods - are discussed. In Part Two, the application of these tools is presented, covering foundations and basements, in situ and precast concrete structures, steel frames, cladding, internal and external works, waste, methods statements, contract planning control and claims. The author provides an extension of the concept of 'buildability' and new chapters on facade retention and the refurbishment of domestic accommodation.

Construction Technology Eric Fleming, 2009-02-12 This new textbook provides a comprehensive introduction to every aspect of the technology of low-rise construction. It includes sub-structure (site work, setting out and foundations) and superstructure (flooring, roofs, finishes, fittings and fixtures). The material here covers the first year course requirement of all courses on which construction technology is taught - no matter what the ultimate qualification. It offers tried and tested solutions to a range of construction problems and is organised following the sequence of construction. It will show what has been done in the past, demonstrating good practice - what works and what doesn't - and common faults. There are summaries of the more important BSI documents and reference to the latest building regulations. Lengthy explanations are avoided by relying heavily on hundreds of illustrations, pairing detail drawings with clear photographs to show real life construction situations.
