International Society of Developmental Biologists

The Cell Surface in Embryogenesis and Carcinogenesis Sanders,1989-11-15 This book covers recent trends in the study of cell surfaces, cell interactions, and cell behavior during selected events in development and cancer. It relates current thrusts in molecular biology to more cellular aspects of these fields and draws parallels between advances in developmental biology, malignant invasiveness, wound healing, and regeneration. The book opens with a discussion of a number of developmental events, stressing the importance of the cell surface and extracellular matrix to morphogenesis, cell locomotion, and invasiveness. Basement membranes are discussed in terms of their activity as substrata for cell movement, barriers to invasion, and their role in epithelial-mesenchymal interactions. These aspects of cell-cell and cell-matrix interaction are directly compared with developmental and neoplastic events, emphasizing the epithelial-to-mesenchymal transformations that are common to both of these situations. Other topics discussed include cell surface considerations, cell-cell adhesion, cell-substratum adhesion, as well as a discussion regarding how these topics are relevant to the cell biology of wound healing and regeneration. This book is ideal for researchers and students in biology, cell biology, biochemistry, molecular biology, anatomy, zoology, and medicine.

The Cell Surface in Development and Cancer Malcolm S. Steinberg,2013-06-29 This series was established to create comprehensive treatises on specific topics in developmental biology. Such volumes serve a useful role in developmental biology, since it is a very diverse field that receives contributions from a wide variety of disciplines. This series is a meeting-ground for the various practitioners of this science, facilitating an integration of heterogeneous information on specific topics. Each volume is intended to provide the conceptual basis for a comprehensive understanding of its topic as well as an analysis of the key experiments upon which that understanding is based. The specialist in any aspect of developmental biology should understand the experimental background of the field and be able to place that body of information in context to ascertain where additional research would be fruitful. At that point, the creative process generates new experiments. This series is intended to be a vital link in that ongoing process of learning and discovery.

Developmental Biology and Cancer Gisele M. Hodges,Charles Rowlatt,1993-09-27 This book addresses possible analogies between cancer and developmental biology. An international group of experts provides a multidisciplinary approach, allowing biological or clinical scientists involved with cancer research to integrate specific information from diverse areas. Five concepts of cancer are presented, and developmental biology is reviewed at five levels. These are integrated in discussions of failure in organisation as a basis of cancer and its control. The book will be a valuable reference for both newcomers as well as experienced biological and clinical scientists. Features
